

***IP/MPLS Network
Planning, Design,
Simulation, Audit and
Management***

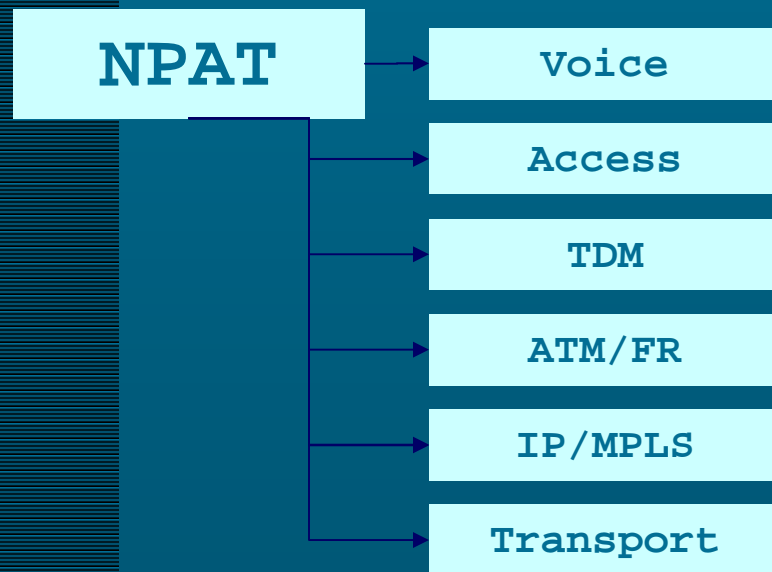

Dave Wang, WANDL

WANDL Overview

- Founded in 1986
- Headquarters in Piscataway, New Jersey
- Products: NPAT, IP/MPLSView, VPNView
- Locations
 - Domestic
 - New Jersey, Washington D.C., Illinois, California
 - International
 - United Kingdom, Belgium, Italy, Taiwan, China

WANDL Software Solutions

WANDL Network Planning
Design & Optimisation

WANDL IP/MPLS Network
Audit & Management

IP/MPLSView

VPNView

Design

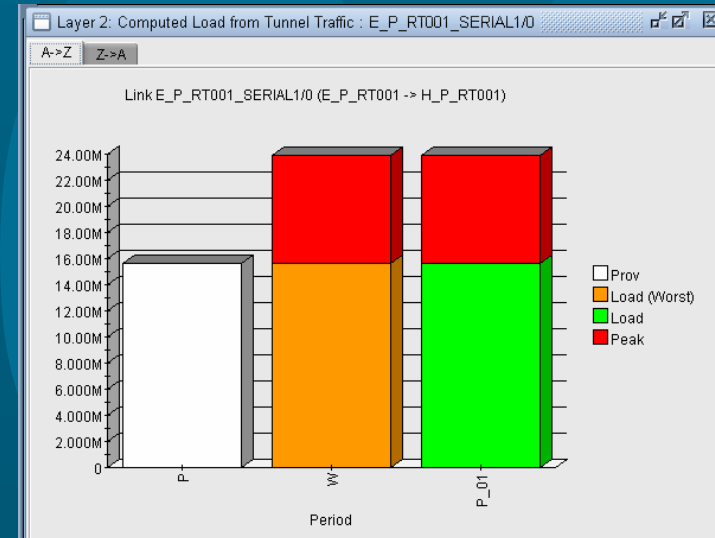

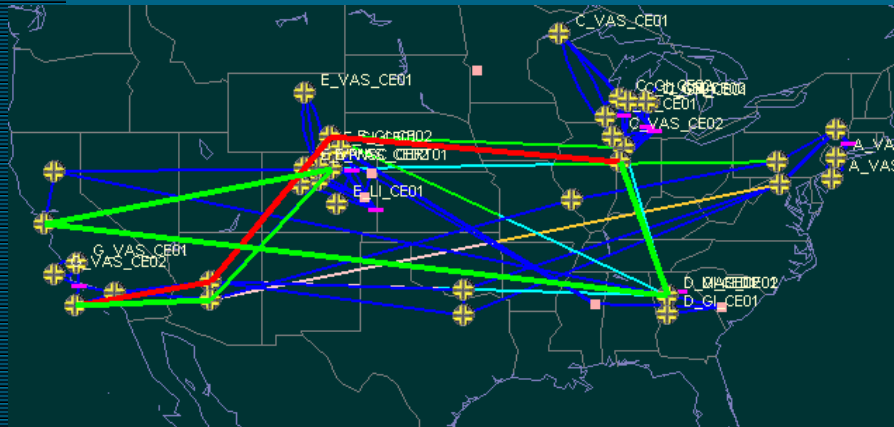

Backbone Design

Access Design

Simulation

- Perform exhaustive failure simulation in script mode
- Verify detailed simulation results via simulation report
- Verify peak utilization for links under failure simulation to resize network (if necessary)

Capacity Planning

- Make recommendations on network expansion
 - forecasted network demands
- Determine where capacity is needed
- Determine trunks that can be pruned
- Tune link routing metrics
- Import NetFlow end-to-end traffic data
 - NetFlow v9, Arbor, cflowd, Crannog
- Guessing traffic matrix
 - if only interface traffic is available

Design Automation

- Basic or Diversity Design
 - Path Computation
 - Diverse Path Computation
 - Network Grooming
 - Fast Reroute Path Computation
 - LSP Tunnel Sizing
 - Metric Balancing
- 

Proactive Service Audit

- Majority outages caused by human error
- Info in router configuration files
- Integrity Checks (IC) based on Config files
 - Detect human errors
 - Detect operational errors
- Intelligent IC based on routing simulation
 - Routing anomalies
 - Security and ACL reachability
 - Network element failures

IP/MPLS Management Features

- Integrated FCAPS
 - Provisioning support
 - Generate VRF Configlets
 - Generate TE/FRR Configlets
 - Multivendor support
-

IP/MPLS Core Platform (Routing, Design, Outage Simulation)

Service Provider Challenges

- Multivendor
- Multilayer
- Multiprotocol
- Multiservice

Multivendor Challenges

- Hardware Vendor

- Hardware Vendor NMS

- 5620 SAM, IPSC, iManager, JUNOscope

- Many Service Management vendors

- HP, IBM, Lucent, Oracle, ...

Multivendor Challenges

- Language problems
- Defaults
- Inter-Op
- Versions/Features
- 3rd party NMS

Language Problems

- ATM example: PVC
 - Alcatel means 5620
 - Cisco and Lucent means SPVC
 - Marconi means Permanently nailed
- Issues for human operators
 - to deal with different terminology
- Issues for modeling software (WANDL)
 - deal with differences automatically

Language Problems

- Config files
 - Output of “show config”
 - IOS, IOX, JUNOS, ...
 - Can be very similar (Command Line Interface)
 - Can be very different (languages)
 - Interfaces
 - Protocols
 - Routing, routing, routing, ...

Language Problems

- Same meaning
 - MPLS Traffic Engineering Tunnel
 - Label Switched Path
- Same meaning
 - Affinity/Mask
 - Admin Group
- Different meaning: MPLS Fast Reroute
 - Path protection
 - Link / Node protection

Defaults

- 1000 means 1 MB or 1 Kb ?
 - Alcatel-Lucent, Cisco, Juniper, etc. different conventions
 - MPLS-TE priority
 - Conventions and defaults on priority and hold settings for LSP
 - Different vendor implementations
 - OSPF reference bandwidth
 - 100,000,000 is no longer adequate
- 

Inter-Op

- MPLS TE multiple color constraints
 - And ? Or ?
 - Different vendor interpretations on logic
- Naming Convention
 - Must name as Tunnelxxx or Tunnelx/y/z
 - Can be arbitrary
- Features and implementation details can be different
 - DS-TE RDM, MAM, etc.

WANDL – 5620 SAM Integration

- Collect configuration and tunnel information from the 5620 SAM
- Offline design/analysis and upload changes to the live network
 - Service activation through SAM XML over SOAP
 - Upload changed information to the SAM
 - Bandwidth changes
 - Path (dynamic/explicit) and FRR properties
 - LSP definitions

Multilayer Challenges

- Shared Risk Link Groups (SRLG)
 - IP/ATM over TDM
 - ATM/TDM over IP
 - IP over Optical/DWDM
- Common failure points with multiple layers
 - Conduit failure > multiple fibre cuts > wavelengths failed > LSP paths down
- LSP backup paths may share common failure points with primary path

Multilayer Challenges

- MPLS itself is a multilayer technology
 - Layer 3 : IP
 - Layer 2 : MPLS-TE
- Interaction between IGP and MPLS-TE
 - AutoRoute Announce
 - Participate in topology state flooding or not
 - No AA

Multiprotocol Challenges

- IGP : OSPF, ISIS, static
 - OSPF areas
 - ISIS level1/level2
 - BGP : iBGP, eBGP, mBGP
 - route reflectors, confederation
 - Carrier Supporting Carrier (CSC)
 - MPLS : LDP, RSVP
 - LDP
 - RSVP, CSPF
- 

MPLS Service Applications

- MPLS VPN
 - Layer 3 RFC2547-bis VPN
 - Replacing ATM/FR services
 - Layer 2, PW, VPLS, CCC
- MPLS TE/FRR
 - Voice, Video, NGN

Multiservice Challenges

- Voice
 - MPLS TE/FRR ?
- Data
 - Diversity
- Video
 - P2MP-TE ?
- CoS, QoS

Multiservice Challenges

- Single or separate networks?
 - Internet
 - MPLS VPN
 - NGN
 - Large service provider
 - may have separate network for each
 - Small service provider
 - may merge all into a single network
- 

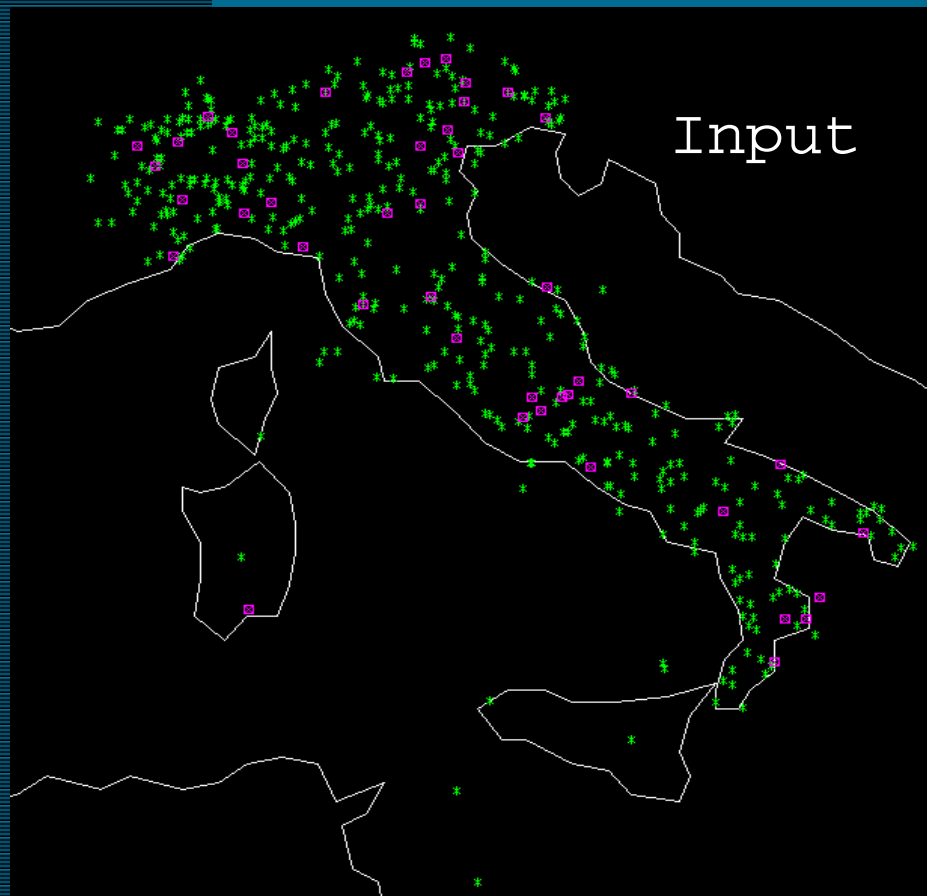

Summary

- In moving toward and IP/MPLS backbone, service providers are facing new and unexpected challenges including multiple vendor environments, multiple layer topologies, and multiple applications and services.
- Network management requires a high-level of visibility into the network in order to accurately model the various layers and interdependencies.
- The observed trend is toward consolidation of OSS tools to simplify data consistency across multiple sources, as well as tool management. Fewer tools that can address a broader scope.
 - WANDL's IP/MPLSView platform addresses fault-management, configuration and performance in the FCAPS framework.

Network Visualization

The slide features a dark blue header bar at the top. The main background is a medium blue color with a faint, semi-transparent globe graphic on the right side. The globe shows latitude and longitude lines. On the left side, there is a vertical bar with a fine, horizontal-line texture. The title 'Network Visualization' is centered in a bold, orange font with a black drop shadow.

Access Homing Design

Wireless backhaul Design

The highlighted links are less than 3.91 miles.

P2MP Hub selection

9000 locations

The slide features a dark blue header bar at the top. The main background is a medium blue color with a faint, semi-transparent globe graphic on the right side. A vertical bar with a fine horizontal line pattern is located on the left side. The title text is centered in the middle of the slide.
